

The slicing geometry and the fundamental ellipse — combined, with the dial axis.

THE SLICING GEOMETRY — p3_overhead.py, reproduced from its own code.
Equator at α ; hinges at 2α ; sides tangent at their midpoints; the Thales circle through the origin and the hinge.

THE FUNDAMENTAL ELLIPSE — $g(r)=g(r_0)$, $g(t)=t^3-t$.
A vertical line at r_0 meets the locus in THREE HORIZONS.

THE DIAL ON THE r_0 AXIS. w and r_0 are ONE axis (monotone, invertible). $2M$ FOLDS at $w = 30\gamma$ — the involution $w \mapsto 60\gamma - w$: past it, the geometry repeats.
