

Daryl's P13/P14 conjecture — everything: four 3-D shadows of one 4-D object ($\mathbb{C}_r \times \mathbb{C}_{\tilde{r}}$), and the ray map

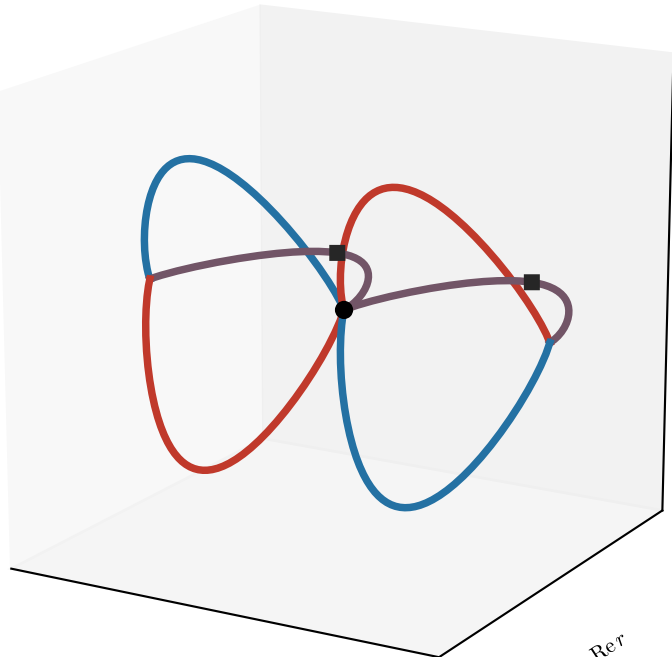

face 1 — r REAL, $\tilde{r}$ complex
 $\arg r = 0, 180 \cdot 6$ branches = 4 beads + 2 mergers

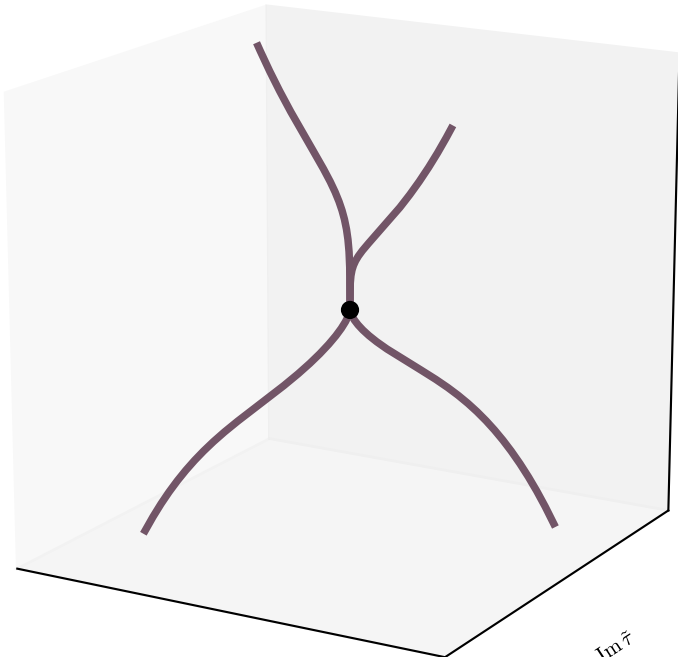

face 2 — $\tilde{r}$ REAL, r complex
 $\arg r = 0, 120, 240 \cdot$ the three sheets

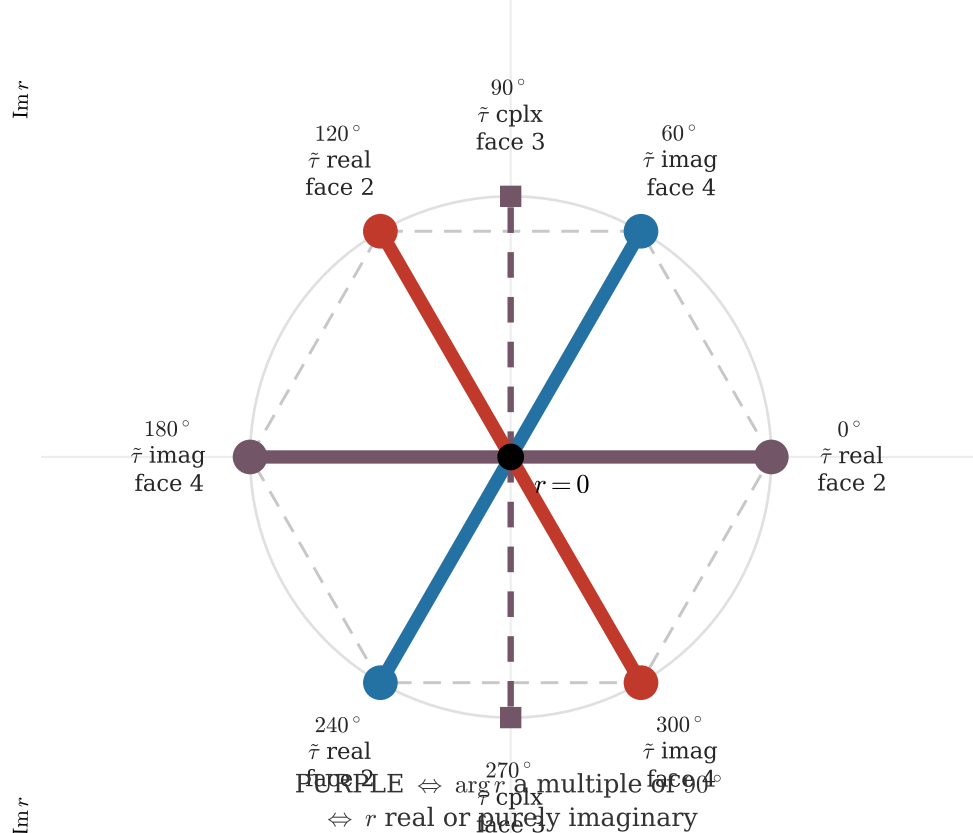

face 4 — $\tilde{r}$ IMAGINARY, r complex
 $\arg r = 60, 180, 300 \cdot$ THE LIFT: $|r| \leq A$, periodic

face 3 — r IMAGINARY, $\tilde{r}$ complex
 $\arg r = 90, 270 \cdot$ TRANSVERSE · ALL PURPLE

the ray map — the four faces in the complex r plane
solid = the hexagon (A_2 roots) · dashed = face 3, off it

THE CONFLICT: face 1 has r REAL ($\arg r = 0, 180$), so by this rule it would be ENTIRELY PURPLE — but it is drawn red/blue by the $\tilde{r}$ quadrants. The rule speaks of MOTION (a bead crossing zero); the map speaks of POSITION. Which is the object's is $[6^*]$, and is not settled by any of these five panels.
